

Garage Door Installation Process

1. Floor Beam Preparation

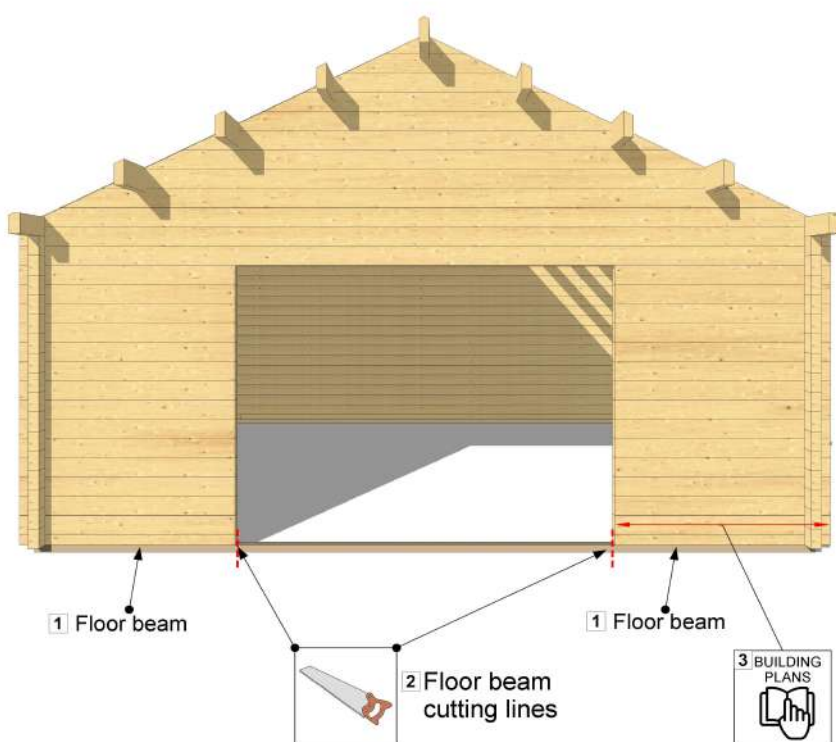

- » The floor beams initially come as solid squares without pre-cut openings
- » You need to carefully study the building plans to determine the exact door location
- » Mark cutting lines on the floor beams where the door opening will be
- » Cut the floor beams at the marked locations before starting assembly

2. Door Frame Installation

- » After cutting the floor beams, install the door frame pieces
- » Position the frame components in the correct places within the opening
- » Secure the frame to the walls with screws

3. Door Installation

- » The doors come separately from the hinges for easier adjustment
- » This allows you to adjust door height and ensure proper alignment on-site
- » Attach the doors to the frame using the provided hinges

Garage door installation –

1. Floor beams;
2. Floor beams cutting lines
