

Tools Required:

A level, ladder, clamp, hammer, chisel, and screw, with special emphasis on the jack plane (highlighted in the red box) which will be particularly useful for fine-tuning the angles and fit.

Tools

Jack - plane

Key Points:

The final wall parts at the very top have unique angled corners that need to contact the roof. You may need to adjust these corners to achieve a proper fit with the roof structure.

Important Tip:

Take your time with the last two cornered parts - they must align evenly with the roof's triangular shape for a proper finish.
